In contrast to vector spaces, we build semivector spaces upon underlying commutative semi-groups, so that the space need not have an origin (identity element) and its elements need not possess inverses. Neither is 0 s required to equal the origin e even if e belongs to the semivector space (0 denotes the additive identity of the field). Also, in the case where the reals are taken as the field, singleton sets need not be convex. These are some of the features distinguishing semivector spaces...
